

PRESENTS

THE PETRIDISH

Culturing the Future of Biotechnology by *BioSoc* | DTU

HIGHLIGHTS

- **Biobytes**
Bite-sized science. Boundary-breaking impact
- **Startups**
From lab benches to boardrooms.
- **Scientists in spotlight**
The minds behind the breakthroughs.
- **Case study**
The minds behind the breakthroughs.
- **Biobusters**
Where science gets questioned.
- **Events in Spotlight**
seminars, hackathons, panels, workshops
- **Alum Interaction**
Insights and advice shared by our alumni.
- **Member Achievement**
the achievements and success stories of our society members.
- **Internship Opportunities**
Explore available internship opportunities.

Biology, Unfiltered

Something powerful is emerging where biology meets technology. PetriDish is not a magazine you skim, it is a space you enter. Designed for students, researchers and industry minds. It brings you closer to the breakthroughs, ideas and people shaping the future of biotechnology.

Each edition brings you curated highlights —spotlighting pioneering scientists, showcasing impactful events, and diving deep into topics shaping the future of biotechnology. Whether you're passionate about biomedical innovations, eager to explore industry trends, or simply curious about the wonders of biotech, The PetriDish is designed to ignite your curiosity and keep you connected to a community that shares your enthusiasm. Join us as we unravel the fascinating interplay of biology and technology, one edition at a time!.

This is where curiosity turns bold and science stops playing safe. Stay sharp, stay curious and step into what comes next.

BIOBYTES

♥ TINY HEARTS, BIG DREAMS

Dutch scientist grew a beating heart in their lab from stem cells.....

Tiny, beating clumps of heart tissue grown from human stem cells in a lab, mimicking early heart development. Purposely to study heart diseases, test drugs, and understanding how the heart forms.

Stem cells coated with specific molecules over several weeks to develop into beating structures

Mutation shaping plant life

Small root mutation could make crops fertilize themselves....

Scientists discovered a small protein region that determines whether plants reject or welcome nitrogen-fixing bacteria by tweaking only two amino acids, they converted a defensive receptor into one that supports symbiosis.

A tiny protein tweak may unlock nitrogen fixing super crops that slash global fertilizer demand.

Break through in regenerative medicine

lab grown human skin with functional sweat glands...

Aims to develop lab grown human skin that fully mimics natural skin including sweat glands, hair follicles, and layered tissue structure. Research is based on stem cell derived organogenesis, where skin cells are guided to self organize into complete 3D structures.

This innovation represents a promising future for burn victims, reconstruction medicine and safer drug/cosmetic testing.

BIOBYTES

The new era of CRISPR:

scientist use CRISPR to delete extra chromosome in down syndrome cells and restore normal function...

Targeting specific extra chromosome, restoring normal gene function in cells.

Researchers design guide RNA (sgRNA) molecules that specifically recognize unique sequences on the extra chromosome.

In cells with extra chromosome was removed leading to faster growth, fewer stress markers and improved biological function.

A glimmer of hope

Nanoparticles reverse Alzheimer's pathology in mice...

A fascinating new development in medical research is highlighting the potential of nanotechnology in the fight against neurodegenerative diseases. Instead of targeting neurons directly, the therapy restores the proper function of the blood-brain barrier, the vascular gatekeeper that regulates the brain's environment. By repairing this critical interface, the researchers achieved a reversal of Alzheimer's pathology in animals.

A powerful reminder that the future of medicine is happening at the nanoscale

From pigs to people:

Pig to human lung xenotransplantation advancing respiratory transplantation and clinical translation...

The first successful pig-to-human lung xenotransplantation using a six gene edited BAMA XIANG PIG in which the lung graft maintained viability and gas exchange for 216 hours in a brain-dead human recipient.

This achievement demonstrates the potential of xenogenic lungs as a future solution to the global shortage of donor organs while highlighting the unique immunological and physiological barriers.

STARTUPS

GINKGO
BIOWORKS™
THE ORGANISM COMPANY

PROGRAMMING LIVING CELLS LIKE SOFTWARE

Ginkgo Bioworks operates in the field of synthetic biology, based on the principle that living cells can be genetically programmed to manufacture useful products. The company rewrites the DNA of microorganisms such as bacteria and yeast so they produce specific molecules including drug ingredients, vaccine components, enzymes, fragrances, and sustainable materials. Instead of slow, traditional lab experimentation, Ginkgo uses robotics, automation, and artificial intelligence to test thousands of genetic designs in parallel and rapidly optimize them. Having raised billions of dollars and partnered with major pharmaceutical, chemical, and agriculture companies, Ginkgo has demonstrated that biology can be engineered and scaled like software, making it one of the most influential platforms in modern biotechnology.

Website : <https://www.ginkgobioworks.com>

LinkedIn : <https://www.linkedin.com/company/ginkgo-bioworks>

MEDGENOME

TURNING DNA INTO MEDICAL DECISIONS

MedGenome works in clinical genomics and precision medicine, focusing on the idea that many diseases originate from genetic variations that can be detected by reading a person's DNA. Using next generation sequencing technologies, the company analyzes large sections of the human genome to identify mutations linked to cancer, rare genetic disorders, inherited diseases, and drug response. Its core strength lies in advanced data analysis that converts complex genetic information into clear and clinically useful reports for doctors. With around \$47 million raised from global investors, MedGenome is helping shift healthcare from symptom based treatment to personalized medicine guided by genetic insight.

David Baker

“Revolutionizing Protein Design in Biotechnology”

David Baker is a renowned American biochemist and computational biologist whose work has completely changed the landscape of biotechnology with his invention of computational protein design. Proteins generally consist of 20 different amino acids, which can be described as life's building blocks. He succeeded in using these blocks to design a new protein that was unlike any other protein.

In 1998, he developed the **Rosetta** modelling platform which enabled accurate protein structure prediction and the subsequent **de nova** (newly) design of proteins with predefined structures & functions. During the 2000s–2010s, Baker's laboratory experimentally demonstrated that enzymes, therapeutic proteins, nanomaterials, and vaccine scaffolds can be rationally designed, validating computational protein engineering through experimental evidence.

These contributions earned him the **Nobel Prize in Chemistry in 2024**. This work established protein design as a predictable, data-driven field and significantly accelerated biomedical research and drug development. It demonstrated that proteins could be designed from scratch with specific structures and functions.

Katalin Kariko

“Architect of Nucleoside-Modified mRNA Technology”

Katalin Kariko, a Hungarian-born biochemist, revolutionized biotechnology by developing **nucleoside-modified mRNA**, which prevents immune reactions while enabling cells to produce therapeutic proteins. Prior to 2005, the biggest weakness in the application of mRNA, which had therapeutic potential, was that it caused an inflammatory response when administered inside a living organism. In a series of groundbreaking studies initiated in 2005, scientists discovered that although the synthesized mRNA produced a high inflammatory response. Kariko in collaboration with Drew Weissman, discovered that replacing **uridine with pseudouridine in mRNA** suppressed immune activation, enabling a safe and effective mRNA-based therapies.

By 2020, her modified mRNA technology formed the basis of the **Pfizer-BioNTech and Moderna COVID-19 vaccines**, which enabled rapid global vaccination. Beyond COVID-19, her discoveries advanced cancer therapies, rare disease treatments, and personalized medicine, establishing mRNA as a safe, versatile, and scalable platform that has saved millions of lives and transformed modern medicine. In 2023, she was awarded the **Nobel Prize in Physiology or Medicine** for her groundbreaking contributions to mRNA science and modern medicine

Dr Souvik Maiti

“Sickle-cell free India”

Dr Souvik Maiti, a leading chemical scientist with an expertise in biology, has made innovative approaches towards drug development using nucleic acids such as microRNAs and DNA quadruplexes as targets. His partnership with Dr Debojyoti Chakraborty has led to several high-impact technologies.

Recently they both, along with serum institute of India (SII), announced the CRISPR based indigenous gene editing tool kit **BIRSA 101**, aiming to provide high quality-affordable gene therapies to more remote tribal communities suffering disproportionately from sickle cell disease a genetic blood disorder forming sickle shaped RBC's causing anaemia, pain crisis & organ complications, highly prevalent in the tribal communities of eastern and central India

This toolkit aims to wipe out this disease under the **NATIONAL SICKLE CELL ANAEMIA ELIMINATION MISSION (2023 – 2047)**, and the clinical trials are set to commence in 2026, with several institutes all over the country hosting participants

Dr Karthik Raman

“Efficient bioprocessing”

Dr Karthik Raman has been revolutionising the field of systems biology through computational research at IIT Madras. One of the most prominent projects carried out under his supervision was the development of the computational framework **CO-FSEOF (Co production flux scanning based on enforced objective flux)**.

This framework guides scientists in identifying optimal genetic interventions of microbes to produce more than one desirable metabolites in a single computational run and also improves carbon utilisation.

This model is based on flux balance analysis (FBA) to predict flux distributions in a **genome-scale metabolic model (GSMM) of a microbe (E. coli & S. cerevisiae)**.

Earlier, the FSEOF model optimised microbes for only one metabolite at a time, making the process computationally expensive and inefficient to scale. Co-FSEOF, therefore, represents a step forward toward sustainable and efficient bioprocessing.

Case Study

A Functional Cure for Type 1 Diabetes Through Personalized Stem Cell Therapy

Introduction

Type 1 diabetes mellitus (T1DM) is a lifelong autoimmune disorder in which the immune system selectively destroys pancreatic β -cells, resulting in absolute insulin deficiency. For nearly a century, disease management has relied on exogenous insulin administration, dietary regulation, and glucose monitoring. While these interventions are life-saving, they do not restore physiological insulin regulation or address the root cause of the disease. In 2024, a landmark clinical case from China reported sustained insulin independence in a woman with long-standing T1DM, marking a significant step toward a functional cure using autologous stem cell therapy.

Conventional Management and Its Limitations

Standard treatment for T1DM involves multiple daily insulin injections or insulin pump therapy combined with continuous glucose monitoring. Although technological advances have improved glycemic control, patients remain vulnerable to hypoglycemia, glycemic variability, and long-term complications such as cardiovascular disease, neuropathy, and kidney failure. Importantly, conventional therapy compensates for insulin deficiency but does not replace the lost β -cell population or correct autoimmune dysfunction.

Earlier curative attempts focused on pancreas or islet transplantation. While these procedures demonstrated that restoring β -cells could eliminate insulin dependence, their clinical use was restricted by donor scarcity, surgical risks, immune rejection, and the requirement for lifelong immunosuppression. As a result, these approaches were unsuitable for widespread application.

Scientific Progress Toward a Regenerative Solution

Over the past two decades, advances in stem cell biology and developmental genetics provided a new direction for diabetes research. Scientists demonstrated that pluripotent stem cells could be guided to differentiate into insulin-producing β -like cells by mimicking embryonic pancreatic development. However, challenges such as incomplete cell maturation, immune rejection, and safety concerns initially limited clinical translation.

The key innovation in this case was the use of autologous induced pluripotent stem cells (iPSCs) derived from the patient herself. This strategy eliminated the risk of immune incompatibility and bypassed ethical concerns associated with donor tissues.

✦ The Clinical Case and Methodology

The patient, a young woman with more than ten years of Type 1 diabetes, underwent a personalized regenerative therapy developed by researchers at Shanghai Changzheng Hospital. Somatic cells from the patient were reprogrammed into iPSCs and then differentiated through a multi-stage protocol into functional insulin-secreting β -cells. These cells exhibited glucose-responsive insulin release and expressed hallmark β -cell markers, indicating physiological maturity.

The differentiated cells were transplanted using a minimally invasive procedure without the need for immunosuppressive drugs. Following transplantation, the cells successfully engrafted and began regulating blood glucose levels autonomously.

✦ Outcomes and Scientific Significance

Post-treatment, the patient achieved complete insulin independence with stable glycemic control sustained for over a year. No major adverse effects were reported. Clinically, this outcome is described as a functional cure, defined as long-term disease remission without ongoing therapy rather than permanent eradication of disease risk.

This case provides compelling proof-of-concept that personalized stem cell therapy can restore endogenous insulin production in Type 1 diabetes. It bridges decades of foundational research with real-world clinical success and highlights the potential of regenerative medicine to treat autoimmune diseases at their biological source.

✦ Looking Ahead

While this achievement is limited to a single patient and remains experimental, it represents a pivotal milestone in diabetes research. Future studies will determine scalability, long-term durability, and accessibility. Nevertheless, this case signals a paradigm shift—from managing Type 1 diabetes to potentially reversing it through precision regenerative therapy.

BIOBUSTER

#Myth 1

“We use only 10% of our brain”

The idea that most of our brain sits unused is oddly comforting. It suggests hidden potential, a secret reserve of genius waiting to be unlocked. Unfortunately, it's also completely false. Brain scans show that nearly every part of the brain is active throughout the day whether we're reading, resting, remembering, or simply staring out of a window. Different regions take turns doing their work, but very little goes unused. In reality, if 90% of the brain were inactive, it would indicate serious neurological damage, not untapped brilliance. This myth survives not because it's true, but because it sounds inspiring.

#Myth 3

“Humans evolved from monkeys”

This is one of the most common misunderstandings about evolution and one of the easiest to correct. Humans did not evolve from the monkeys we see today. Instead, humans and modern monkeys share a common ancestor that lived millions of years ago. Evolution doesn't work like a ladder with humans at the top; it's more like a branching tree, with different species adapting to different environments over time. Monkeys are not our past they are our evolutionary relatives, shaped by their own paths of survival.

#Myth 5

“More protein automatically means more muscle”

Protein has become the nutritional hero of our time added to bars, shakes, even bottled water. But muscle growth doesn't work on protein alone. Building muscle requires resistance training, enough overall calories, proper sleep, and time for recovery. Without these, extra protein does very little. The body can only use so much; the rest is either excreted or stored as fats. Muscle isn't built through shortcuts or excess it's built through consistency, effort, and balance

#Myth 2

“You're 100% human”

Biologically speaking, the human body is less an individual and more a shared space. Around 43% of the human body contains human cells, the rest belong to trillions of bacteria, fungi, and other microbes that live on your skin, in your gut, and throughout your body. Even genetically, humans carry around 20,000 genes while our microbial companions contribute millions more. These invisible partners help digest food, train the immune system, and influence mood and mental health. Being “human,” it turns out, has always been a collective effort

#Myth 4

“Cancer is a modern disease”

It's tempting to blame cancer entirely on modern life problems like pollution, processed food, stress, screens. But cancer is far older than cities or industry. Ancient Egyptian medical texts, including the Edwin Smith Papyrus dating back to around 1600 BCE, describe breast tumors that physicians already recognized as untreatable. The evidence goes even further back: archaeologists have identified a case of bone cancer in a 1.7-million-year-old hominin fossil from South Africa, the oldest known example of the disease. Modern lifestyles may influence how often cancer occurs, but the disease itself is woven deep into our biological history.

#Myth 6

“Plants lack any form of communication”

Plants don't speak, but they are anything but silent. Research has revealed that plants communicate through chemical signals, electrical impulses, and vast underground fungal networks called mycorrhizae. When attacked by insects, some plants release airborne chemicals that warn neighboring plants, prompting them to activate their defenses. Beneath the soil, roots are in constant dialogue with microbes and nearby plants, sharing nutrients and information. Communication, it turns out, doesn't require words or even a brain. It only requires connection

Events in Spotlight

Mother dairy industrial visit (May 24th,2025)

Biosoc DTU took learning beyond classroom with an industrial visit to mother dairy. From automated pasteurization lines to fermentation, we got a real time look at food biotechnology in action. This visit perfectly blended technical insights with industry-scale operations and show us how biotechnology helps deliver safe and delicious milk to millions everyday.

Hack-eye-thon @yosicon 2025 (September 5th,2025)

A space where biology met innovation to solve ophthalmic challenges. This event emphasized on technology enabled healthcare. Guided by expert mentors and participants work with scientific rigor to design ideas for improving eye care; it was innovation with purpose

Orientation'25 and Talkshow (September 3rd,2025)

Star Speakers: Dr. Abhay Mishra, Samridhi Sharma. The orientation session was a welcoming introduction where Biosoc DTU connected with juniors and shared the society's vision, goals, and opportunities. To make the experience more interactive and relatable, a talk show was organized featuring Samridhi Sharma, a PW educator, and Abhay Sir, a scientist at AIIMS. Through open discussions, the speakers addressed common doubts and misconceptions about biotechnology, sharing real insights into academics, research, and career pathways.

HHTRF x Biosoc DTU (October 29th,2025)

Biosoc team collaborated with HHTRF NSUT for research internship exploring the future of sustainable agriculture. It aimed to equip young researchers with practical skills and innovative approaches to address challenges in sustainable agriculture.

Biosoc x Cybercell,DRC

(August 12th,2025)

BioSoc DTU, in collaboration with CyberCell DRC, organized the webinar 'From Hackers to Helices' to introduce students to the emerging overlap of cybersecurity and bioinformatics. With insights from **Director General of Police(DGP)** IPS Manoj Abraham and Ashwin Ragav, the session highlighted the importance of protecting scientific data in the digital age. The event reflected BioSoc's commitment to promoting interdisciplinary learning and expanding perspectives beyond core biotechnology.

Talkshow with Ashu Ghai sir

(October 10th,2025)

The talk show with Ashu Sir was an interactive session that focused on content creation and teaching as emerging career paths. Through open conversation, he shared his personal journey, addressed student queries, and offered practical insights into building impact through education and digital platforms.

ICGEB (JNU CAMPUS)

(November 10th,2025)

BioSoc DTU organized an industrial visit to the ICGEB, JNU campus, offering students valuable exposure to advanced research facilities and ongoing work in molecular biology and biotechnology. The visit helped bridge classroom learning with real-world research practices and scientific innovation.

ALUM INTERACTION

PRAJAKTA TIWARI

MTech Biomanufacturing, IIT Roorkee

“

To all my juniors—don't let tough phases make you doubt yourself. I had a fairly smooth BTech journey, but MTech challenged me in ways I hadn't expected. It's more intense, more demanding, and honestly humbling at times. What matters most is persistence—setbacks are part of the process, not a sign of failure. BioSoc played a huge role in my growth; the seniors, mentors, and exposure to opportunities really shaped my confidence. Be open to paths you didn't plan for—sometimes the most exciting ideas and innovations lie exactly there.

”

BHARMAJEET DAHIYA

PhD Scholar, ICGEB

“

To all my juniors—remember that everyone's journey unfolds differently. When I was at your stage, I didn't have a fixed plan for where I would end up, and that's completely okay. What mattered most was staying curious, putting in consistent effort, and being open to learning at every step. Don't compare your progress with others—focus on your own growth and trust the process. Actively look for opportunities, ask questions, and don't hesitate to reach out to seniors for guidance. With persistence and an open mindset, things eventually fall into place.

”

ISHI THAKUR

Analyst, Everest Group

“

One thing I'd tell every junior—explore without fear. I tried my hand at multiple domains—coding, bioinformatics, and even non-tech roles—before finding what truly suited me. What really kept me going was the peer group in BioSoc. Being surrounded by motivated, ambitious people pushes you to work harder and aim higher without even realizing it. Value your peers, learn from every experience, and make the most of opportunities—each one teaches you something important.

”

SANYAM JAIN

PhD Scholar, NTU Singapore

“

Hey juniors, it's completely okay to feel unsure at the start. I never imagined I'd be doing this much wet-lab work alongside coding, but over time, I grew to enjoy the challenge. Choosing a Direct PhD after BTech can feel intimidating, but trust me—consistent effort and curiosity make things manageable. Keep your options open, talk to seniors, ask questions, and use BioSoc as your support system. No one expects you to have everything figured out on day one.

”

Member Achievement corner

Research Internships and competition

Samihan Sharma (3rd Yr B.Tech Biotech)

General Secretary | Internship, Conference & Publication

Selected for a winter research internship at IISc, working on learning and memory studies using advanced neuroscience and machine-learning tools, alongside conference presentations and peer-reviewed publications in synthetic biology and sustainability.

Rishabh Mohan Sinha (3rd Yr B.Tech Biotech)

President | Conference Paper Presentation

Presented a deep learning-based research paper on radiation-induced chromosome classification at ICABSB-2025, held at IIT Roorkee, in collaboration with INMAS, DRDO. Additionally, completed summer research internship at CSIR-IGIB, working on machine learning models for analysis of human brain EEG signals.

Krishna Singhal (3rd Yr B.Tech Biotech)

Vice President | Research Internship

Completed a summer research internship at IIT (BHU), gaining hands-on experience in nanoparticle synthesis, biomedical experimentation, and antibacterial studies.

Ayushi Pandey (2nd Yr B.Tech Biotech)

Junior Council | Internships

Completed industry and research internships at EY, Kale Logistics Solutions, and HHTRF, gaining hands-on experience in data analysis, AI/ML, and real-world business and logistics datasets.

Mukund Gupta (2nd Yr B.Tech Biotech)

Junior Council | Competition / Hackathon

Secured second prize at the YOSICON YOSI Hackathon, demonstrating strong innovation, teamwork, and technical problem-solving skills.

Aryaman Bansal (2nd Yr B.Tech Biotech)

Junior Council | Internship

Selected for HPAIR 2026, completed the HHTRF-NSUT research internship, cleared the initial selection round at NCBS, and is currently interning under DSW through the USIP programme.

Parth Jeph (2nd Yr B.Sc Biotech)

Junior Council | Research Internship

Worked as a research intern at AIIMS New Delhi, focusing on genomics, proteomics, and phylogenetic analysis of Alport syndrome in the Indian population.

Bharti Yadav (2nd Yr B.Sc Biotech)

Junior Council | Research Internship

Worked as a research intern at DRDO-DIPAS, Delhi, acquiring hands-on experience in molecular biology techniques including PCR, ELISA, and gel electrophoresis.

Nandini (2nd Yr B.Sc Biotech)

Junior Council | Research Internship

Completed her first research internship at AFRS, gaining exposure to forensic science applications and building a strong foundation in applied research methodologies.

Hrishit Gupta (2nd Yr B.Sc Biotech)

Junior Council | Research Internship

Completed a summer research internship at AIIMS New Delhi, working on apoptosis and anastasis with hands-on exposure to advanced molecular biology techniques.

Yash Maheshwari (3rd Yr B.Tech Biotech)

Member | Research Internship

Completed a summer research internship at CSIR-IGIB, working on machine learning models for the analysis of human brain EEG signals and physiological signals including ECG and PPG.

Charu Agrawal (1st Yr M.Sc Biotech)

Member | Research Internship

Completed a full-time summer research internship at NII, Delhi, studying host circadian rhythm alterations during *Toxoplasma gondii* infection under expert mentorship.

Vivek Gupta (2nd Yr B.Tech Software)

Member | Competition / Hackathon

Winner of Smart India Hackathon (SIH), with the achievement featured in Education Times, highlighting innovation, teamwork, and problem-solving excellence.

Etant Rustagi (1st Yr B.Tech Biotech)

Member | Startup & Innovation Achievements

Core member of ZYNQ, a student-led startup that won DTU IIF-IIC PitchWeek, ranked among DTU's top startups, and shortlisted for NASSCOM Tech4Change.

Internship opportunities

1. CSIR-IICB Summer Internship Programme

- Portal to Apply: <https://www.iicb.res.in/internship>
- Duration: Summer (May–July)
- Eligibility: Life science/biotech students
- Apply by: 31 Jan 2026 (2026 cycle)
- Focus: Research projects at CSIR-IICB, Kolkata.

2. NGSF Internship Program 2026

- Portal to Apply: <https://cni.iisc.ac.in/opportunities/research-intern/>
- Duration: Spring/Summer cycle
- Eligibility: Undergrad & masters (life/comp sci)
- Apply by: 28 Feb 2026 (Summer'26 deadline)
- Focus: Research projects at Centre for Networked Intelligence (IISc).

3. CNI Research Internships – IISc

- Portal to Apply: <https://ngsf.in/ngs-internship-program/>
- Duration: ~2–3 months (May–July 2026)
- Eligibility: UG & PG students (life sciences)
- Apply by: Typically Dec–Mar cycle opens early year
- Focus: Fully funded research under mentors at Indian institutes.

4. Science Academies' Summer Research Fellowship 2026

- Portal to Apply: <https://webjapps.ias.ac.in/fellowship2026/index.html>
- Duration: ~8–10 weeks (May–July 2026)
- Eligibility: UG/PG science students
- Selection Info: Guide concurrence sent ~Mar–Apr 2026
- Focus: Research placements with Science Academy-approved mentors.

5. TIFR Hyderabad Summer Research Programme

- Portal to Apply: <https://www.tifrh.res.in/academics/vsrp/>
- Duration: ~8 weeks (May–July 2026)
- Eligibility: Science/engineering students
- Apply by: Announcements usually Jan–Mar 2026
- Focus: SSRP research project placements, faculty-guided.

6. ICMR-NIE Monthly Internship

- Portal to Apply: <https://nie.gov.in/pages/internship>
- Duration: Short-term (1–4 weeks); apply monthly
- Eligibility: UG/PG life science students
- Application: 1–7 of every month — apply early for Feb/Mar starts
- Focus: Disease surveillance & epidemiology projects.
